(57) Abstract: The present invention provides a combinatorial approach to a library of novel compounds having four diversity points. The compounds provide for the mapping of urotensin II and somatostatin 5 receptors by differential binding of said receptors. Accordingly, the invention relates in a first aspect to novel compounds of the general formula I to V or salts thereof, The present invention further relates to a method of treating diseases for which modulation of the urotensin II receptor produces a physiologically beneficial response in said disease, such as those associated with CNS function and cardiovascular diseases. The present invention further relates to pharmaceutical compositions comprising these agents for the -treatment of these diseases adapted to modulate the urotensin II receptor.
